

29) Allocation to location (large-scale business)

Description

Each year, the ERI (Netherlands Pollutant Release & Transfer Register for individual businesses) records the emissions to water and air of around three thousand individual sources. These are generally large businesses, but they also include wastewater treatment plants and airports. Emissions of these sources are allocated directly to their locations. The greater part of the information is based on the mandatory annual environmental reports (the electronically filed eMJV). Data on airports are provided by the Netherlands Organization for Applied Scientific Research (TNO), data on sewage treatment plants by Statistics Netherlands (CBS).
